Junctions

Ron Burback

Lecture 13

Junctions

- The CDS is not just one name space but a collection of name spaces spliced together at junction points.
- /.:/fs - managed by DFS
- /.:/sec - managed by security
- /.:/hosts/host_name/config managed by dced

Why Junctions?

- The power of a unified name space. example: URLs (almost)
- If you can get to the name, you should be able to get to the thing.
- I can ACL set on CDS, Security, and DFS objects with the same commands.

It would be nice if ....

- We had a database junction.
- email folder junction
- URLs done right
