

CS 245: Database System Principles

Notes 10: More TP

Steven Whang

Sections to Skim:

- Section 18.8 [18.8]
- Sections 19.2 19.4, 19.5, 19.6 [none, i.e., read all Ch 19]
- [In the Second Edition, skip all of Chapter 20, and Sections 21.5, 21.6, 21.7, 22.2 through 22.7]

Chapter 19 [19] More on transaction processing

Topics:

- Cascading rollback, recoverable schedule
- Deadlocks
 - Prevention
 - Detection
- Long transactions (nested, compensation)

Concurrency control & recovery

Example:

<u>T_j</u>	<u>T_i</u>
⋮	⋮
W _j (A)	⋮
⋮	r _i (A)
⋮	Commit T _i
⋮	⋮
Abort T _j	⋮

☛ Non-Persistent Commit (Bad!)

Concurrency control & recovery

Example:

<u>T_j</u>	<u>T_i</u>
⋮	⋮
W _j (A)	⋮
⋮	r _i (A)
⋮	Commit T _i
⋮	⋮
Abort T _j	⋮

☛ Non-Persistent Commit (Bad!) avoided by recoverable schedules

Concurrency control & recovery

Example:

<u>T_j</u>	<u>T_i</u>
⋮	⋮
W _j (A)	⋮
⋮	r _i (A)
⋮	w _i (B)
⋮	⋮
Abort T _j	⋮
	[Commit T _i]

☛ Cascading rollback (Bad!)

Concurrency control & recovery

Example:

<u>T_j</u>	<u>T_i</u>
⋮	⋮
W _j (A)	r _i (A)
⋮	⋮
⋮	w _i (B)
⋮	⋮
Abort T _j	⋮
	[Commit T _i]

➡ Cascading rollback (Bad!)

avoided by
avoids-cascading-
rollback (ACR)
schedules

- Schedule is conflict serializable
- T_j → T_i
- But not recoverable

- Need to make "final" decision for each transaction:
 - **commit decision** - system guarantees transaction will or has completed, no matter what
 - **abort decision** - system guarantees transaction will or has been rolled back (has no effect)

To model this, two new actions:

- C_i - transaction T_i commits
- A_i - transaction T_i aborts

Back to example:

<u>T_j</u>	<u>T_i</u>
⋮	⋮
W _j (A)	r _i (A)
⋮	⋮
	C _i ← can we commit here?

Definition

T_i reads from T_j in S (T_j ⇒_S T_i) if

- (1) w_j(A) <_S r_i(A)
- (2) a_j <_S r_i(A) (<_S : does not precede)
- (3) If w_j(A) <_S w_k(A) <_S r_i(A) then a_k <_S r_i(A)

Definition

Schedule S is recoverable if whenever $T_j \Rightarrow_S T_i$ and $j \neq i$ and $C_i \in S$ then $C_j <_S C_i$

Note: in transactions, reads and writes precede commit or abort

- ⇒ If $C_i \in T_i$, then $r_i(A) < C_i$
 $w_i(A) < C_i$
- ⇒ If $A_i \in T_i$, then $r_i(A) < A_i$
 $w_i(A) < A_i$

- Also, one of C_i, A_i per transaction

How to achieve recoverable schedules?

⇒ With 2PL, hold write locks to commit (strict 2PL)

<u>T_j</u>	<u>T_i</u>
⋮	⋮
W _j (A)	⋮
⋮	⋮
C _j	⋮
u _j (A)	⋮
⋮	r(A)

⇒ With validation, no change!

- S is recoverable if each transaction *commits* only after all transactions from which it read have committed.
- S avoids cascading rollback if each transaction may *read* only those values written by committed transactions.

- S is strict if each transaction may *read and write* only items previously written by committed transactions.

Where are serializable schedules?

Examples

- Recoverable:
 - $w_1(A) w_1(B) w_2(A) r_2(B) c_1 c_2$
- Avoids Cascading Rollback:
 - $w_1(A) w_1(B) w_2(A) c_1 r_2(B) c_2$
- Strict:
 - $w_1(A) w_1(B) c_1 w_2(A) r_2(B) c_2$

Assumes $w_2(A)$ is done without reading

Deadlocks

- Detection
 - Wait-for graph
- Prevention
 - Resource ordering
 - Timeout
 - Wait-die
 - Wound-wait

Deadlock Detection

- Build Wait-For graph
- Use lock table structures
- Build incrementally or periodically
- When cycle found, rollback victim

Resource Ordering

- Order all elements A_1, A_2, \dots, A_n
- A transaction T can lock A_i after A_j only if $i > j$

Problem : Ordered lock requests not realistic in most cases

Timeout

- If transaction waits more than L sec., roll it back!
- Simple scheme
- Hard to select L

Wait-die

- Transactions given a timestamp when they arrive ... $ts(T_i)$
- T_i can only wait for T_j if $ts(T_i) < ts(T_j)$...else die

Example:

Starvation with Wait-Die

- When transaction dies, re-try later with what timestamp?
 - original timestamp
 - new timestamp (time of re-submit)

Starvation with Wait-Die

- Resubmit with original timestamp
- Guarantees no starvation
 - Transaction with oldest ts never dies
 - A transaction that dies will eventually have oldest ts and will complete...

Second Example:

Second Example (continued):

One option: T_1 waits just for T_3 , transaction holding lock. But when T_2 gets lock, T_1 will have to die!

Second Example (continued):

Another option: T_1 only gets A lock after T_2, T_3 complete, so T_1 waits for both $T_2, T_3 \Rightarrow T_1$ dies right away!

Second Example (continued):

Yet another option: T_1 preempts T_2 , so T_1 only waits for T_3 ; T_2 then waits for T_3 and $T_1 \dots \Rightarrow T_2$ may starve?

Wound-wait

- Transactions given a timestamp when they arrive ... $ts(T_i)$
- T_i wounds T_j if $ts(T_i) < ts(T_j)$
else T_i waits

“Wound”: T_j rolls back and gives lock to T_i

Example:

Starvation with Wound-Wait

- When transaction dies, re-try later with what timestamp?
 - original timestamp
 - new timestamp (time of re-submit)

Second Example:

Second Example (continued):

One option: T₁ waits just for T₃, transaction holding lock. But when T₂ gets lock, T₁ waits for T₂ and wounds T₂.

Second Example (continued):

Another option: T₁ only gets A lock after T₂, T₃ complete, so T₁ waits for both T₂, T₃ ⇒ T₂ wounded right away!

Second Example (continued):

Yet another option: T₁ preempts T₂, so T₁ only waits for T₃; T₂ then waits for T₃ and T₁... ⇒ T₂ is spared!

User/Program commands

Lots of variations, but in general

- Begin_work
- Commit_work
- Abort_work

Nested transactions

User program:

```

:
Begin_work;
:
:
If results_ok, then commit work
else abort_work
    
```

Nested transactions

User program:

```
⋮
Begin_work;
  Begin_work;
    ⋮
    If results_ok, then commit work
    else {abort_work; try something else...}
  ⋮
If results_ok, then commit work
else abort_work
```

CS 245

Notes 10

43

Parallel Nested Transactions

```
T1: begin_work
    ⋮
    parallel:
      T11: begin_work
            ⋮
            commit_work
      T12: begin_work
            ⋮
            commit_work
    ⋮
    commit_work
```

Locking

Locking

What are we really locking?

CS 245

Notes 10

45

Example:

```
Ti    ⋮
      Read record r1
      ⋮
      Read record r1
      ⋮
      Modify record r3
      ⋮
```

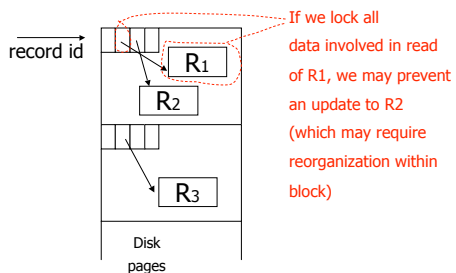

do record locking

CS 245

Notes 10

46

But underneath:

CS 245

Notes 10

47

Solution: view DB at two levels

Top level: record actions
record locks
undo/redo actions — logical

e.g., Insert record(X,Y,Z)
Redo: insert(X,Y,Z)
Undo: delete

CS 245

Notes 10

48

Low level: deal with physical details
latch page during action
 (release at end of action)

Note: undo does not return physical DB to original state; only same logical state

Logging Logical Actions

- Logical action typically span one block (physiological actions)
- Undo/redo log entry specifies undo/redo logical action
- Challenge: making actions idempotent
 - Example (bad): redo insert \Rightarrow key inserted multiple times!

Solution: Add Log Sequence Number

Log record:

- LSN=26
- OP=insert(5,v2) into P
- ...

Still Have a Problem!

Compensation Log Records

- Log record to indicate undo (not redo) action performed
- Note: Compensation may not return page to exactly the initial state

At Recovery: Example

Log:

...	lsn=21 T1 a1 p1	...	lsn=27 T1 a2 p2	...	lsn=35 T1 a2 ⁻¹ p2	...
-----	--------------------------	-----	--------------------------	-----	--	-----

What to do with p2 (during T1 rollback)?

- If $lsn(p2) < 27$ then ... ?
- If $27 \leq lsn(p2) < 35$ then ... ?
- If $lsn(p2) \geq 35$ then ... ?

Note: $lsn(p2)$ is lsn of p copy on disk

Recovery Strategy

[1] Reconstruct state at time of crash

- Find latest valid checkpoint, Ck , and let ac be its set of active transactions
- Scan log from Ck to end:
 - For each log entry [lsn, page]:
 - if $lsn(page) < lsn$ then redo action
 - If log entry is start or commit, update ac

Recovery Strategy

[2] Abort uncommitted transactions

- Set ac contains transactions to abort
- Scan log from end to Ck :
 - For each log entry (not undo) of an ac transaction, undo action (making log entry)
- For ac transactions not fully aborted, read their log entries older than Ck and undo their actions

Example: What To Do After Crash

Log:

chk pt	...	lsn=21 T1 a1 p1	...	lsn=27 T1 a2 p2	...	lsn=29 T1 a3 p3	...	lsn=31 T1 a3 ⁻¹ p3	...	lsn=35 T1 a2 ⁻¹ p2	...
-----------	-----	--------------------------	-----	--------------------------	-----	--------------------------	-----	--	-----	--	-----

During Undo: Skip Undo's

Log:

Related idea: Sagas

- Long running activity: T_1, T_2, \dots, T_n
- Each step/transaction T_i has a compensating transaction T_{i-1}
- Semantic atomicity: execute one of
 - T_1, T_2, \dots, T_n
 - $T_1, T_2, \dots, T_{n-1}, T_{n-1}^{-1}, T_{n-2}^{-1}, \dots, T_1^{-1}$
 - $T_1, T_2, \dots, T_{n-2}, T_{n-2}^{-1}, T_{n-3}^{-1}, \dots, T_1^{-1}$
 - ⋮
 - T_1, T_1^{-1}
 - nothing

Summary

- Cascading rollback
Recoverable schedule
- Deadlock
 - Prevention
 - Detectoin
- Nested transactions
- Multi-level view
